Presentation

Objectives

To assimilate the formalism of the potential flows with the aim of introducing bases for the Reynolds large flow modeling and in particular for aerodynamics. An introduction to the dynamics of vorticity is also proposed.

Description

- Superposition of potential flows.
- Efforts exerted by a potential flow on an obstacle (formulas of Blasius). D'Alembert's paradox, Joukowski's theorem.
- Condition of Kutta.
- Method of the conformal transformation to obtain the lift of a wing profile (example of the transformation of Zhukovsky).
- Basic notion of swirling dynamics.

This teaching will be divided into 5 Courses and 6 TDs.
